Can't Miss Radiology Diagnoses

Jennifer W. Uyeda, MD
Assistant Professor of Radiology
Associate Division Chief, Emergency Radiology

October 2024

HARVARD MEDICAL SCHOOL
TEACHING HOSPITAL

Financial Disclosures

I have no relevant financial disclosures.

Lecture Outline

Over the next 50-55 minutes, the audience will be able to:

- Interpret basic chest radiographs
- Recognize and locate various tubes and lines
- Identify “can’t miss radiology diagnoses” on plain x-ray and CT
- Discuss various imaging protocols and considerations
- Recognize the pros and cons of IV and PO contrast use in CT
- Optimally triage renal failure and contrast allergy patients

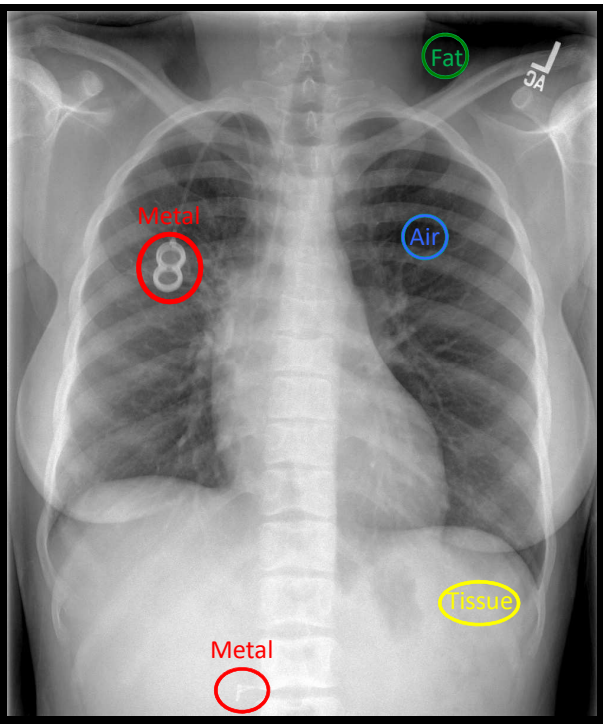
Part I: Interpreting chest radiographs

"Opacities could represent atelectasis, pleural effusion, or pulmonary edema, however, airspace disease/pneumonia cannot be excluded."

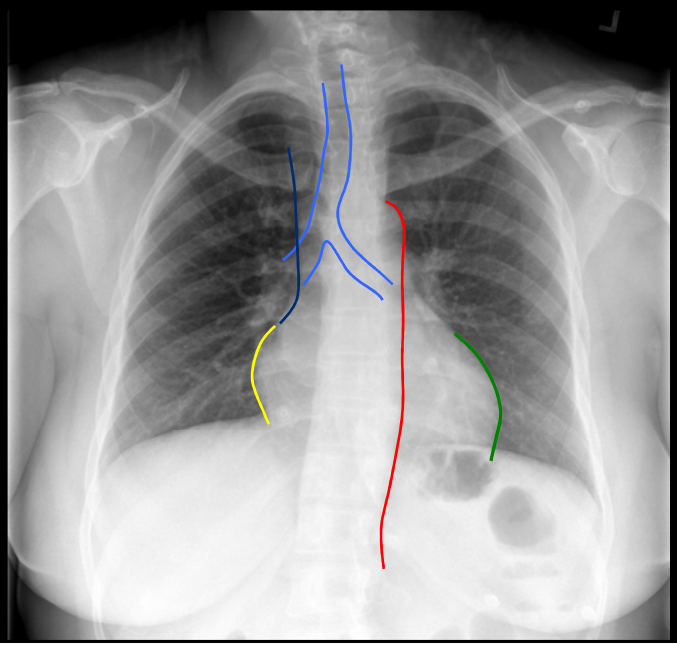
Conventional Radiographs

1. Air
2. Fat
3. Tissue (water)
4. Metal (bone)

#1



Normal Chest Radiograph



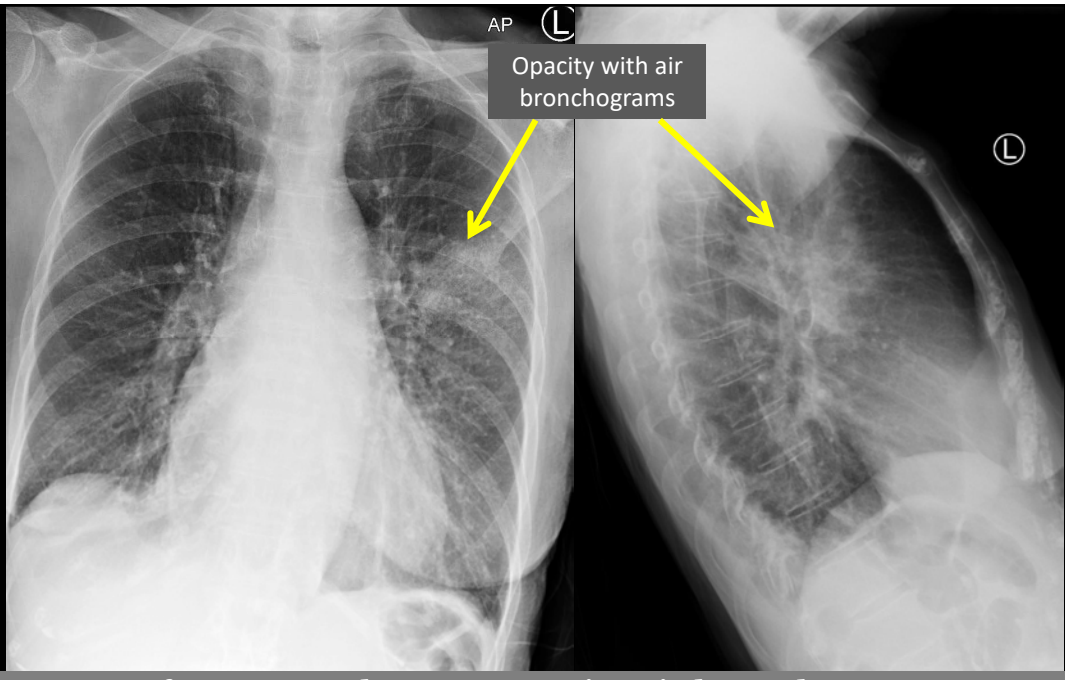
Trachea

Right paratracheal stripe: SVC

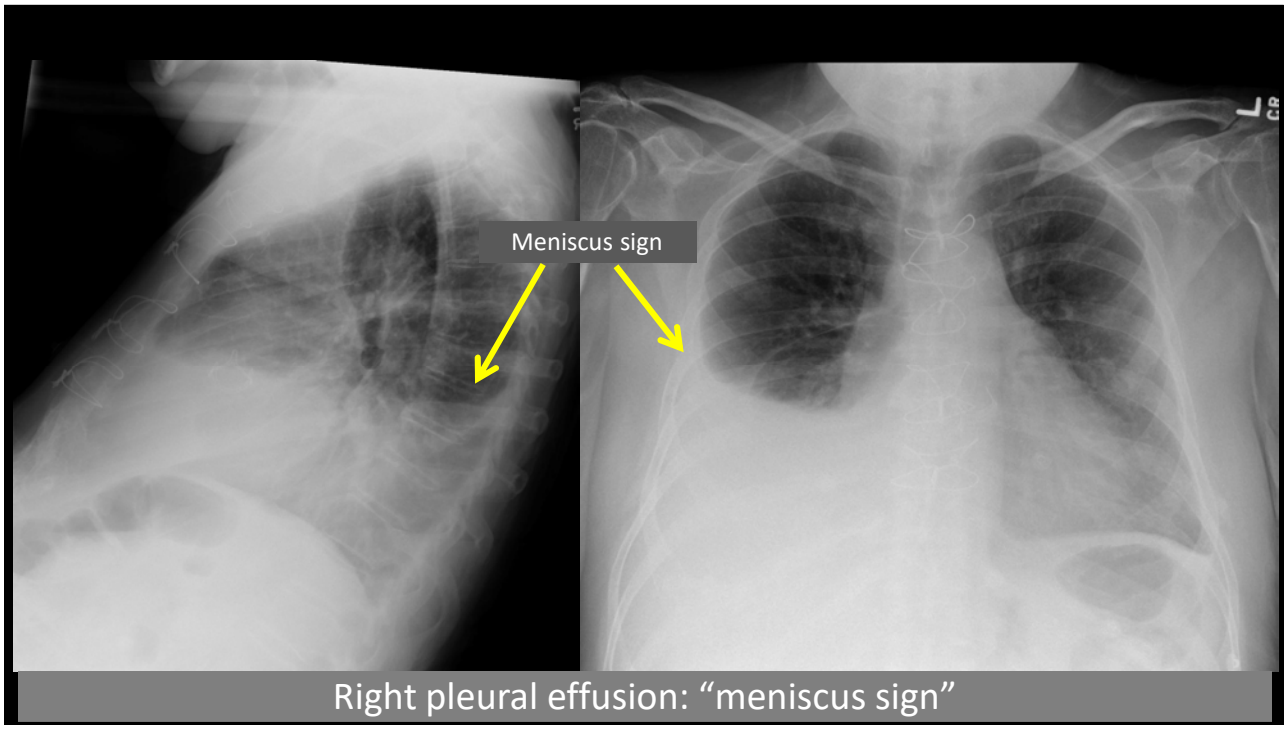
Aortic knob and descending thoracic aorta

Right heart border: Right atrium

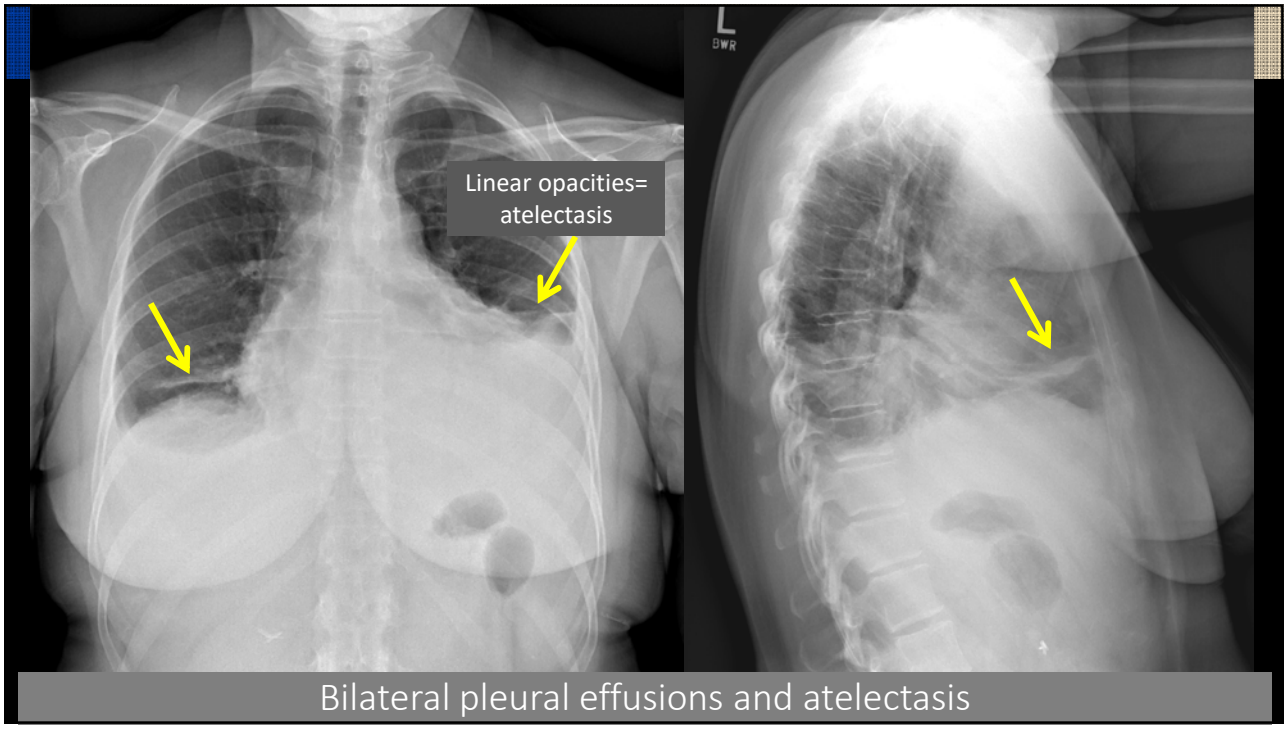
Left heart border: left ventricle



Left Upper Lobe Pneumonia: air bronchograms



Right pleural effusion: “meniscus sign”



Bilateral pleural effusions and atelectasis

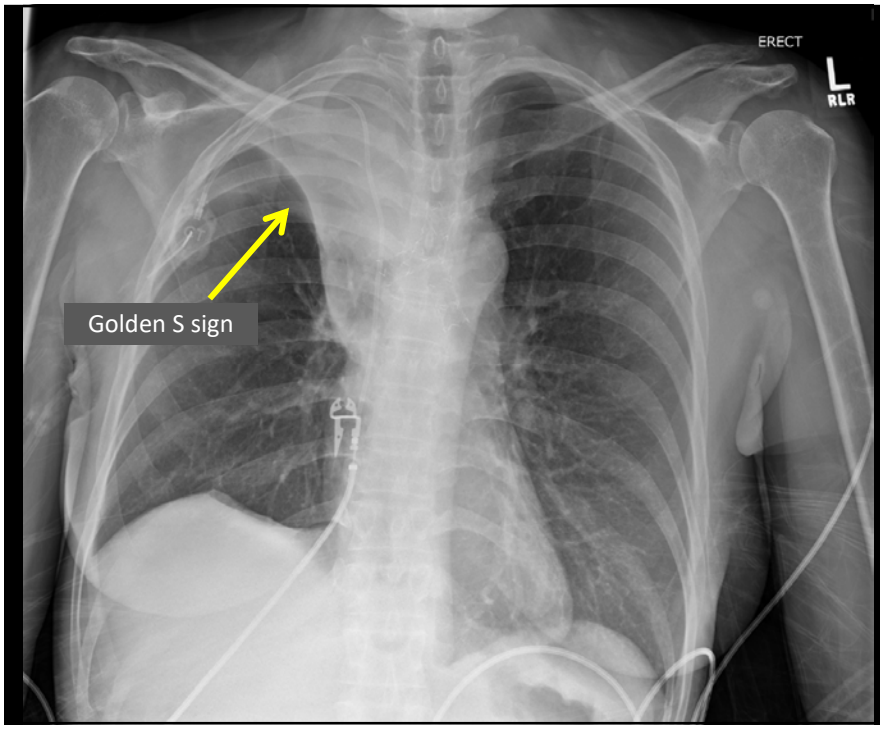
0
Pulmonary edema



Right upper lobe collapse

Complete whiteout: Atelectasis vs. Effusion

Atelectasis

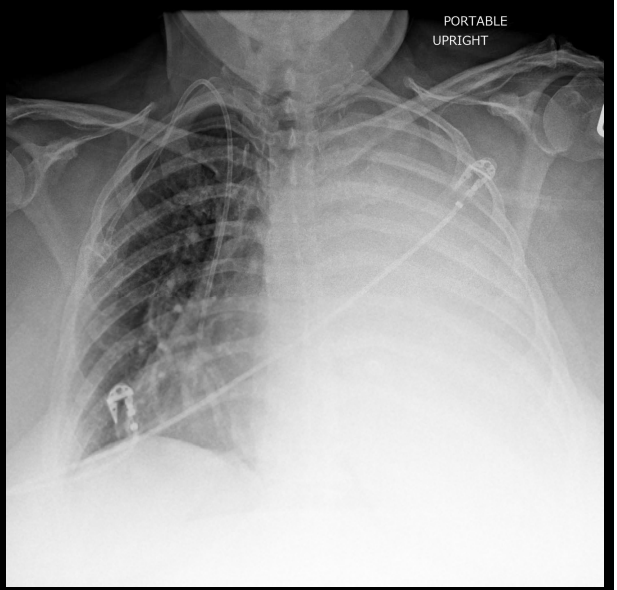
Imaging findings:

Whiteout with volume loss-elevation of hemidiaphragm and ipsilateral tracheal & mediastinal shift

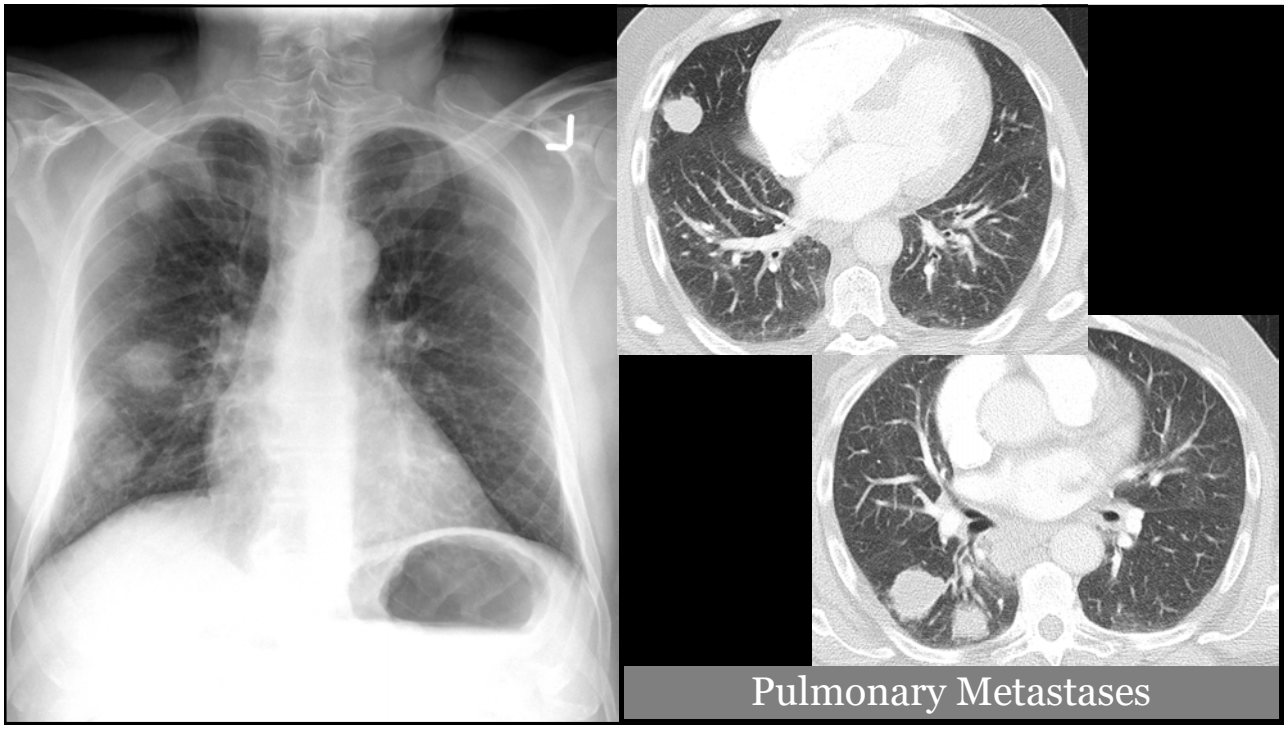
Large Pleural Effusion

Imaging findings:

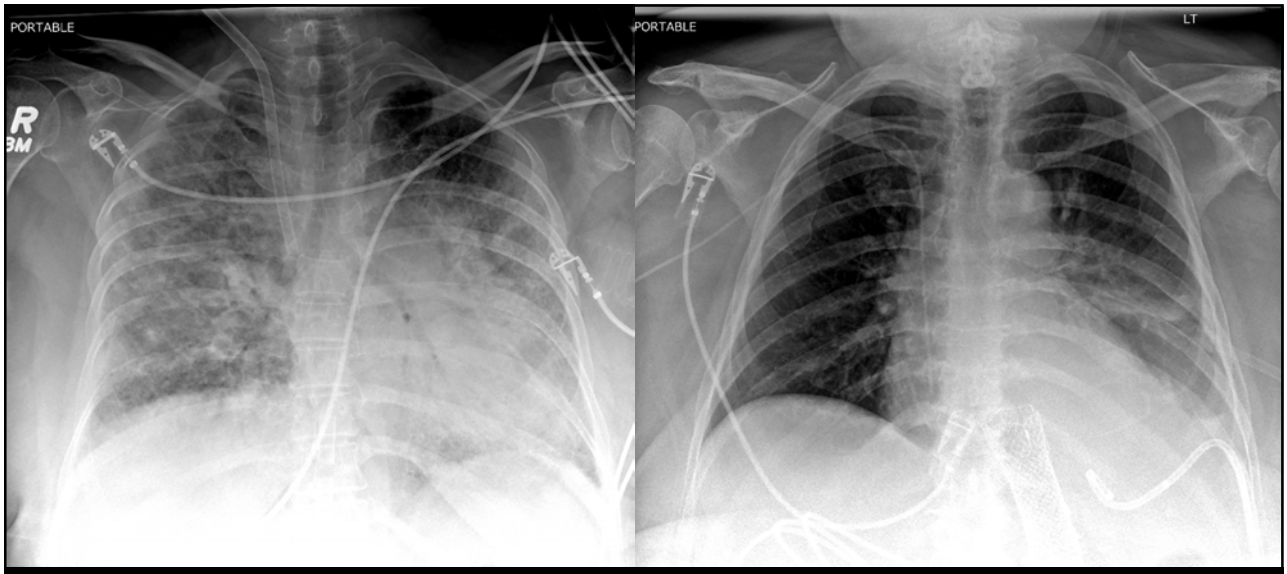
Whiteout with mass effect-contralateral tracheal & mediastinal shift



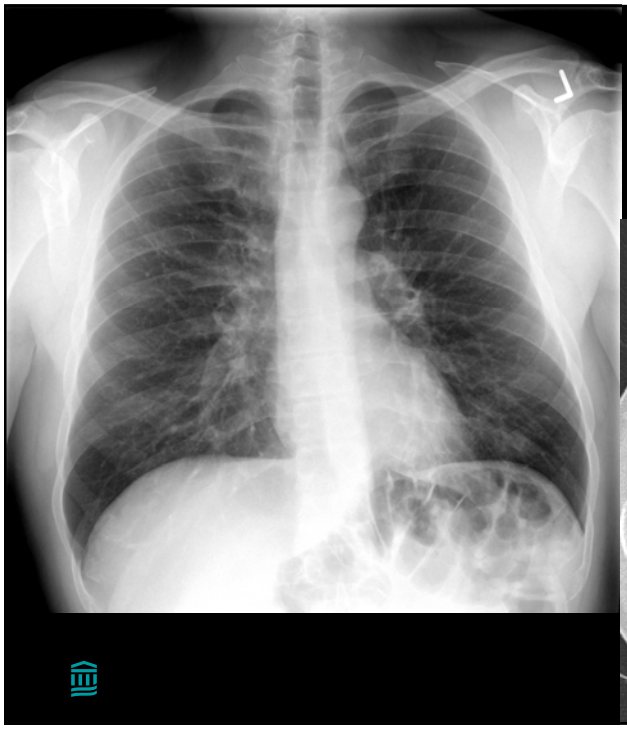
1200 mL serosanguineous fluid



Pulmonary Metastases

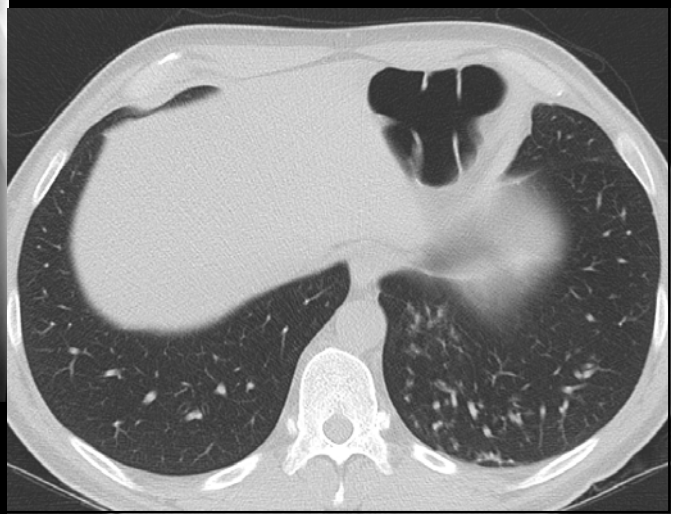


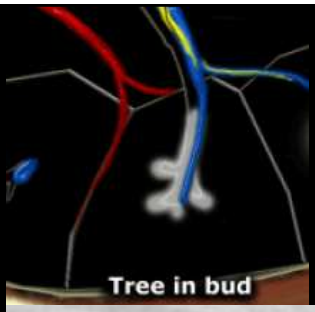
"Opacities could represent atelectasis, pleural effusion, or pulmonary edema, however, airspace disease/pneumonia cannot be excluded."

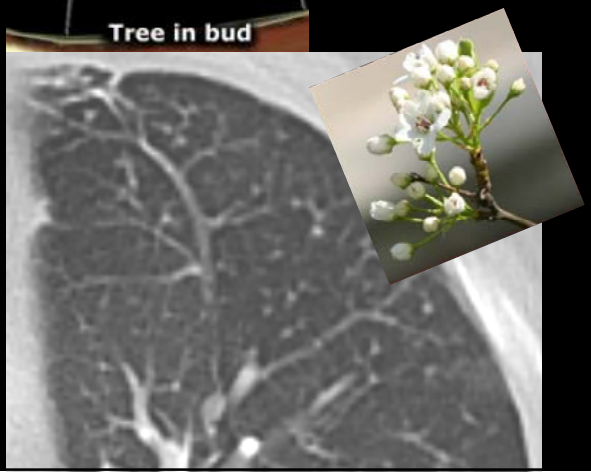


#2

CT has better contrast discrimination







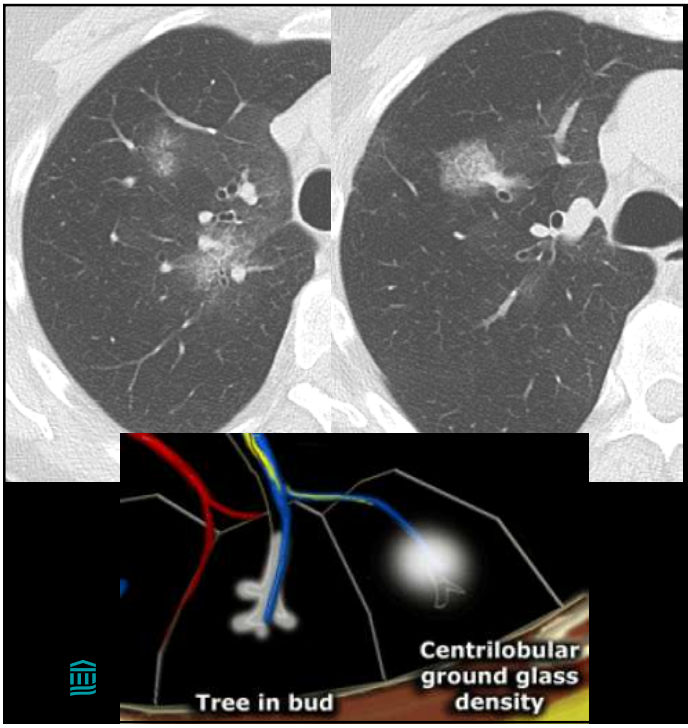
“Tree-in-bud” opacities

Irregular, nodular branching pattern
Represent dilated and impacted centrilobular bronchioles

Infection (endobronchial spread)
- bacterial, fungal, MAC

Airway disease
- CF, bronchiectasis

Allergic bronchopulmonary aspergillosis
Aspiration



“Ground Glass” Opacities

Increased lung attenuation without obscuring underlying vessels
Replacement of air in alveoli by

- Fluid (pus, edema, hemorrhage),
- Cells (tumor),
- Fibrosis

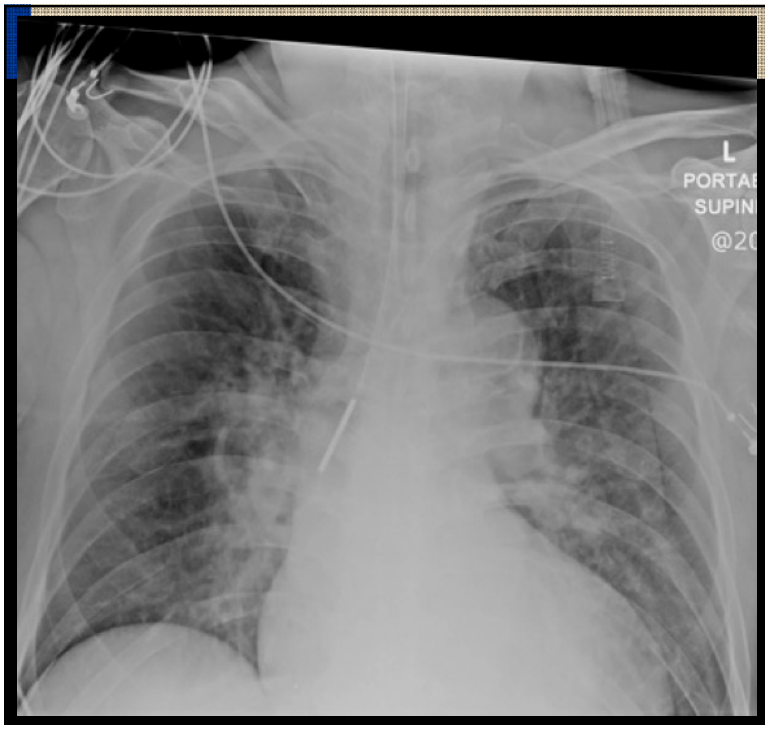
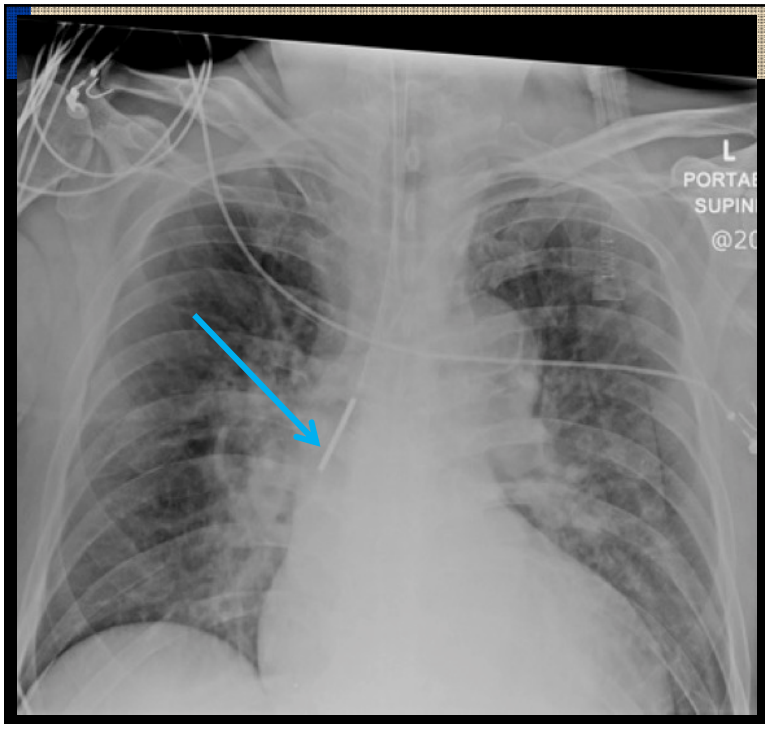
Q1. What is the most concerning finding on this CXR?
A. Location of feeding tube
B. Pulmonary edema
C. Left pneumothorax
D. Right lung pneumonia



HARVARD MEDICAL SCHOOL TEACHING HOSPITAL

Q1. What is the most concerning finding on this CXR?

A. Location of feeding tube
B. Pulmonary edema
C. Left pneumothorax
D. Right lung pneumonia



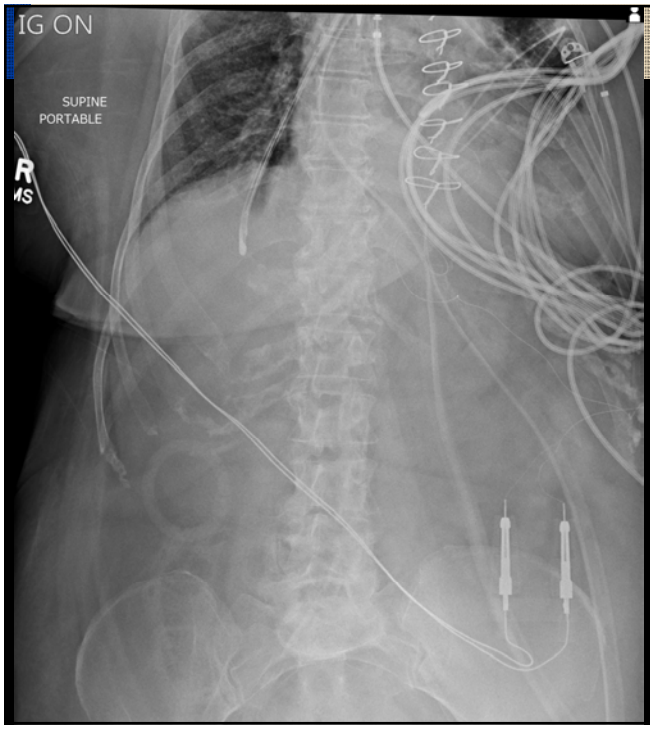
HARVARD MEDICAL SCHOOL TEACHING HOSPITAL

A. Location of feeding tube

Dobhoff tube is incorrectly located in the right mainstem bronchus.

Correct position: esophageal with tip below the diaphragm.

Do NOT feed the patient! Reposition Dobhoff.



HARVARD MEDICAL SCHOOL TEACHING HOSPITAL

Q2. What is the next best step for this patient?

A. SBO oral contrast pathway
B. Exploratory laparotomy
C. Barium enema
D. Thoracic surgery consultation
E. Urology consultation

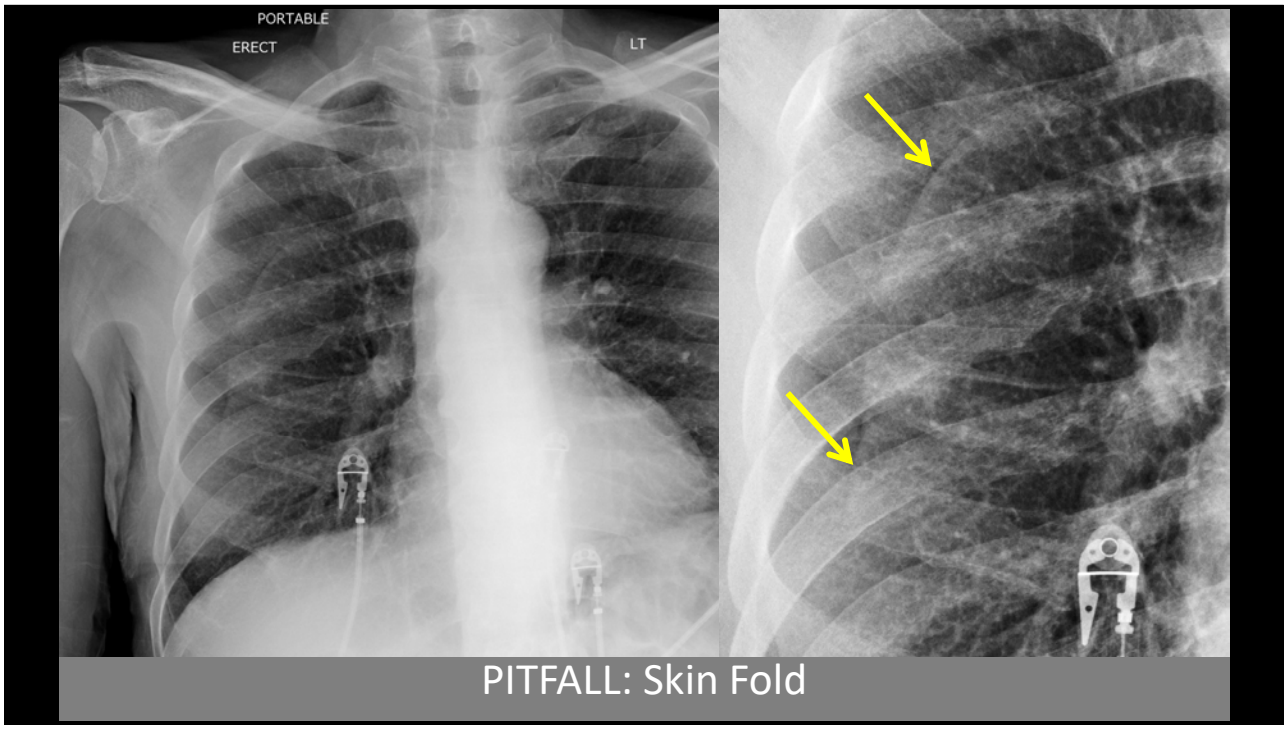
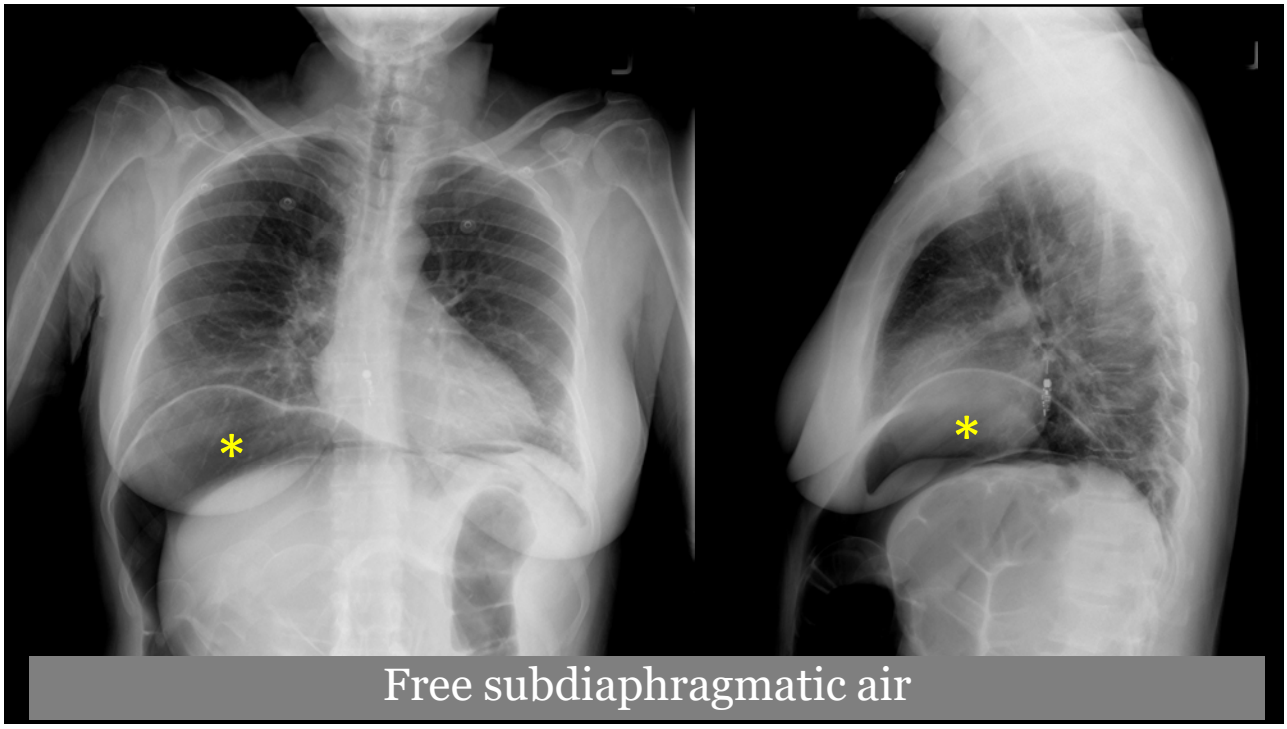
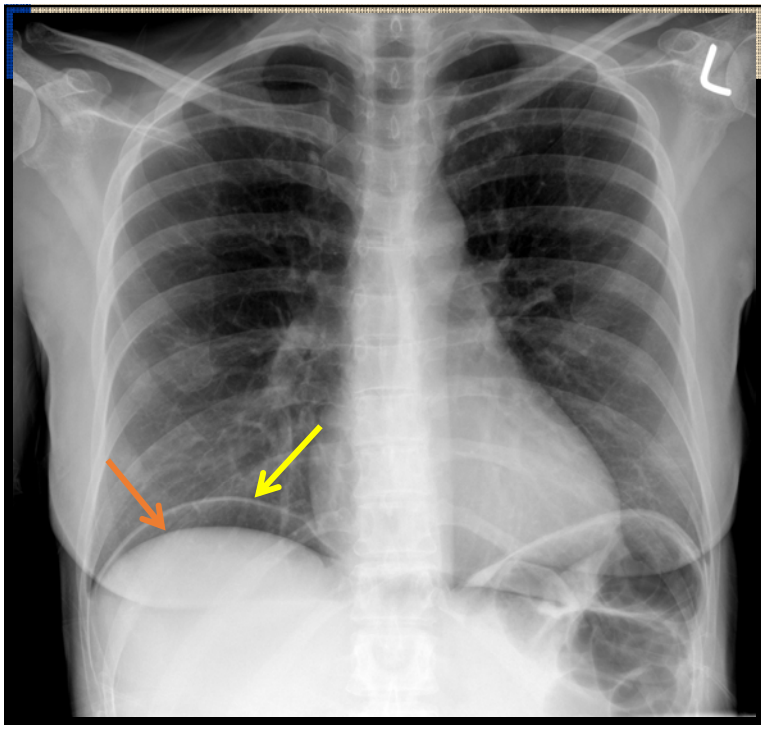
UPRIGHT
AP
Pneumothorax



PITFALL: Skin Fold



Free subdiaphragmatic air



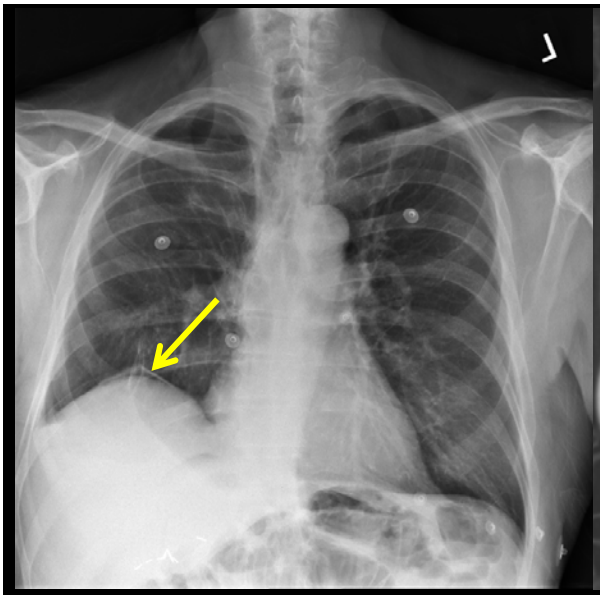
HARVARD MEDICAL SCHOOL TEACHING HOSPITAL

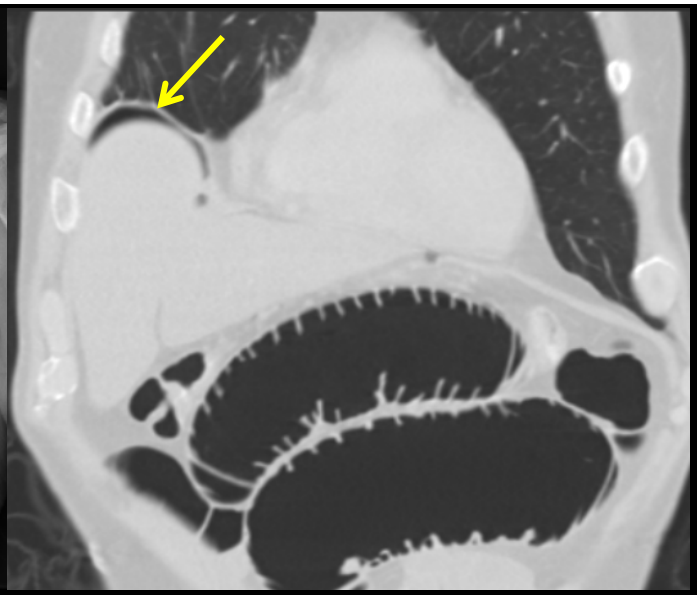
Subtle free subdiaphragmatic air

Identify liver & diaphragm

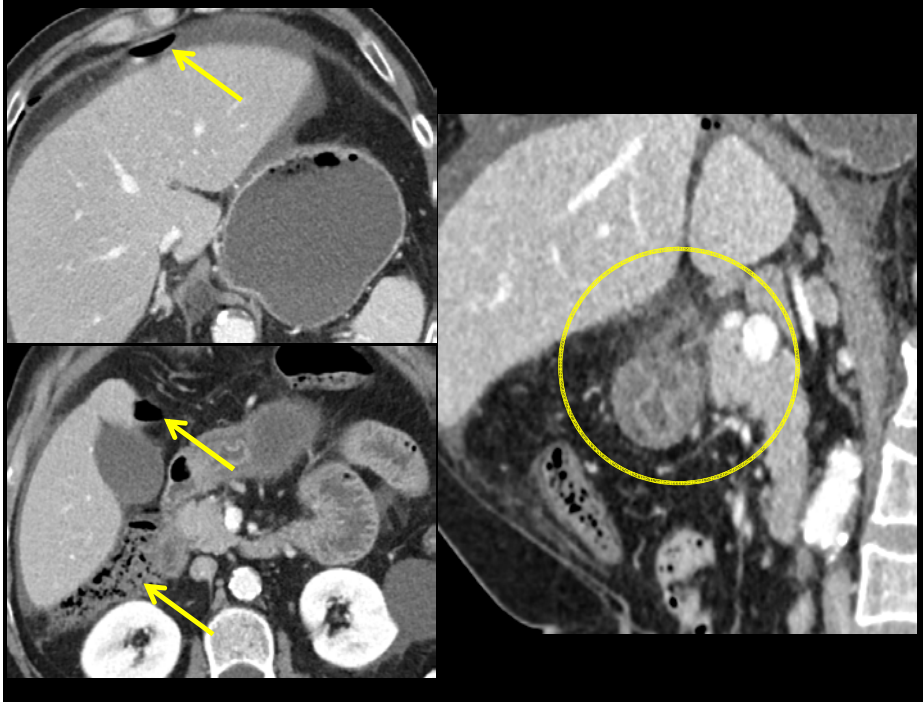
Lucency under hemidiaphragm

UPRIGHT radiograph is helpful to identify antidependent air





Upright CXR can depict intraperitoneal gas as a lucency under the diaphragm
CT is more sensitive for the detection of pneumoperitoneum and CT also shows the site of perforation in up to 85% of actual perforation sites.

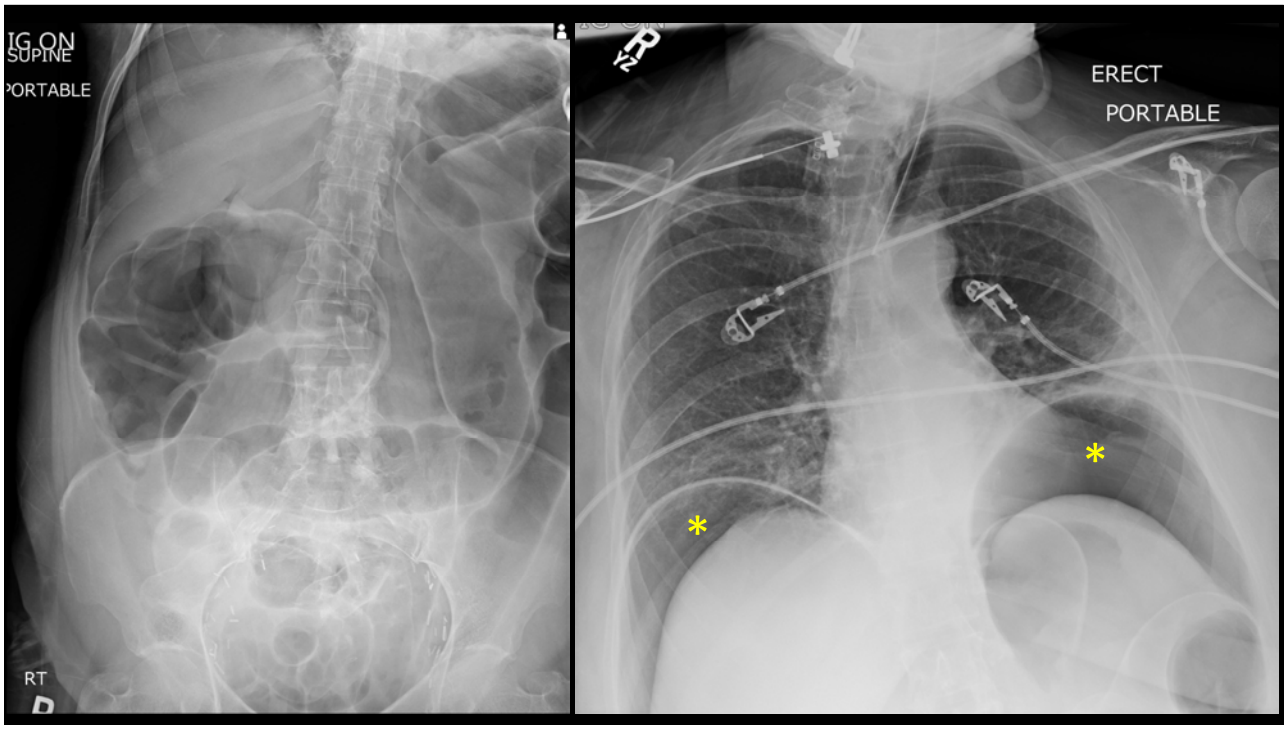


Perforated Bowel: Peptic Ulcer

One of the most common causes of perforated bowel

Free Intraperitoneal Air

- Abdominal emergency requiring surgical or percutaneous intervention
- Contained perforations can be managed conservatively
- Most common sources:
  - Perforated diverticulitis
  - Perforated peptic ulcers
  - Others: perforated carcinoma, bowel ischemia
- Iatrogenic:
  - Post endoscopy, colonoscopy
  - Postoperative

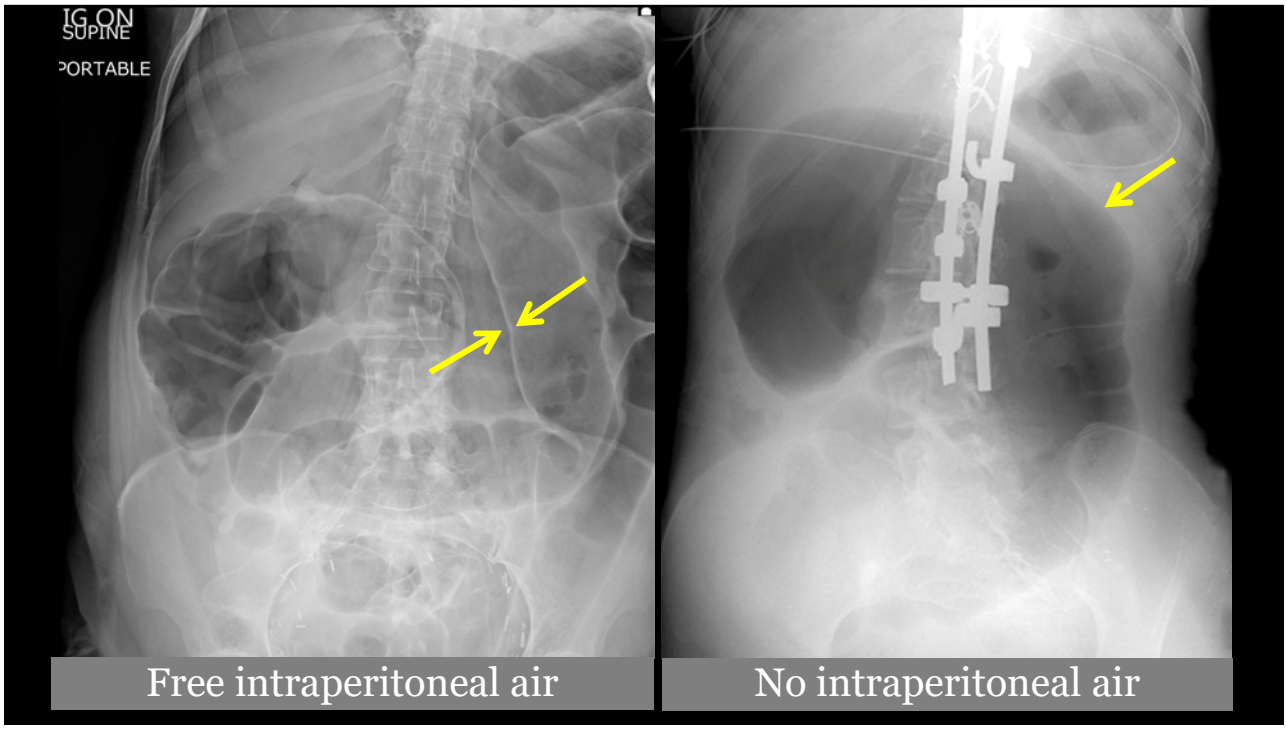


Free intraperitoneal air

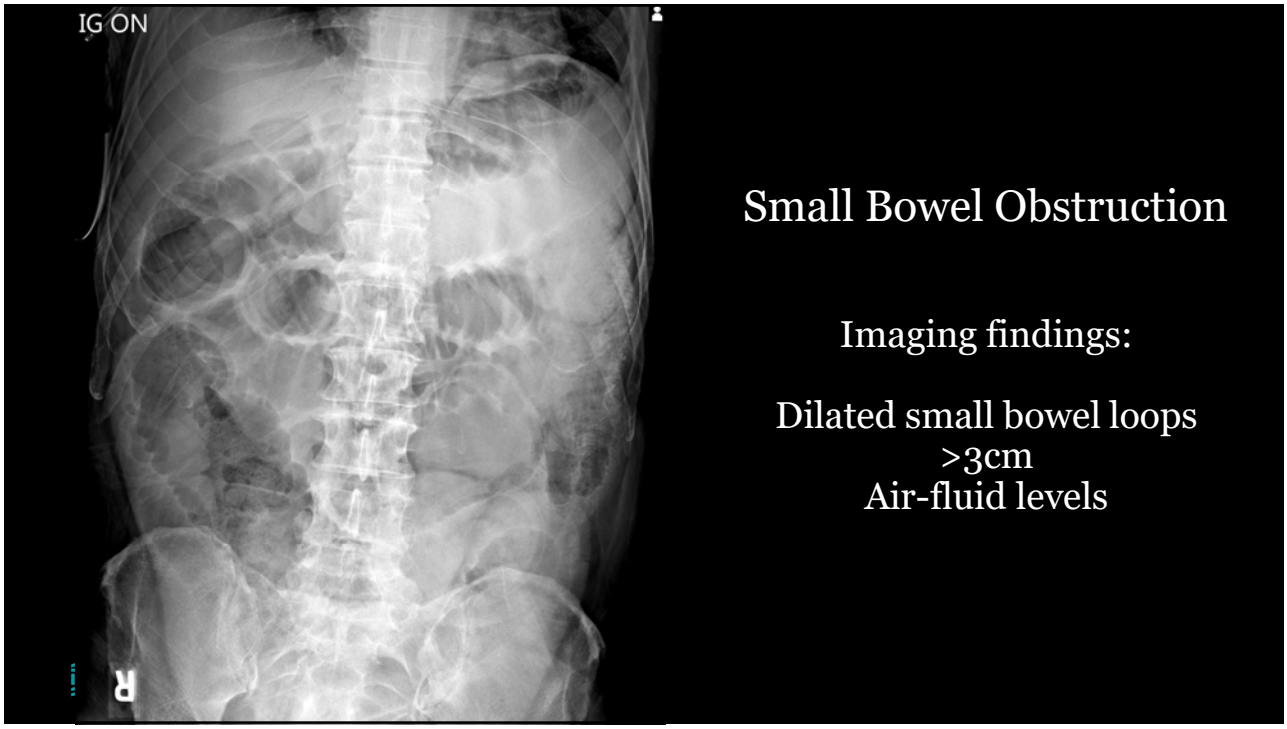
Rigler Sign

Imaging findings:

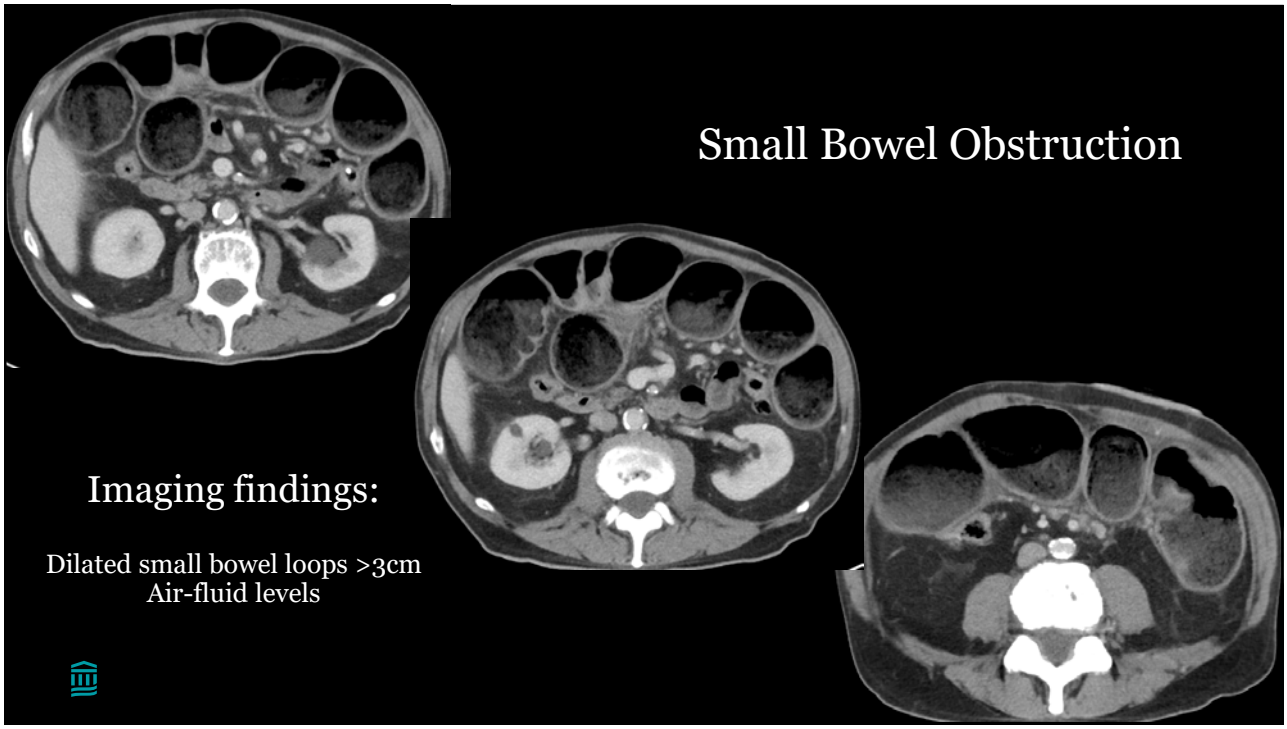
Air is seen on both sides of the bowel wall (intraluminal AND peritoneal side)



IG ON
SUPINE
PORTABLE
Free intraperitoneal air
No intraperitoneal air

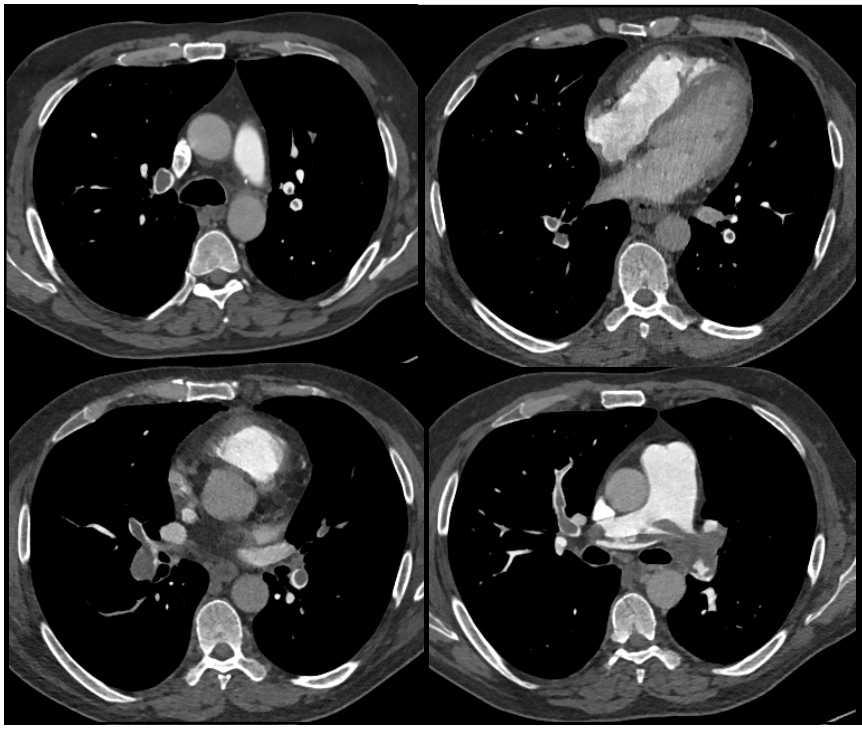


IG ON
R
Small Bowel Obstruction
Imaging findings:
Dilated small bowel loops
>3cm
Air-fluid levels



BWH Adhesive SBO pathway

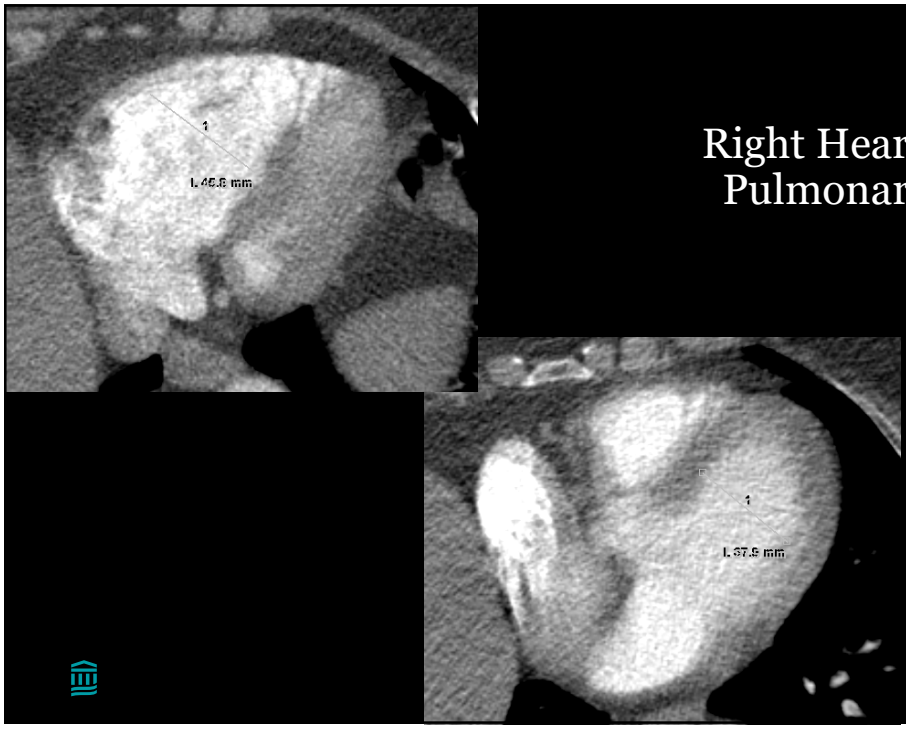
- Trial of conservative management of SBO
  - 80% SBO will resolve without surgery
  - High grade SBO can be safely managed non-operatively
  - Iodinated water soluble PO contrast that reaches colon within 24 hours indicates SBO will resolve without surgery
    - 97% sensitivity, 96% specificity
  - Current guidelines recommend that patients without resolution undergo surgery by 3-5 days
- Exclusion criteria:
  - Cancer, pregnancy, intra-abdominal infection



Saddle Pulmonary Embolism

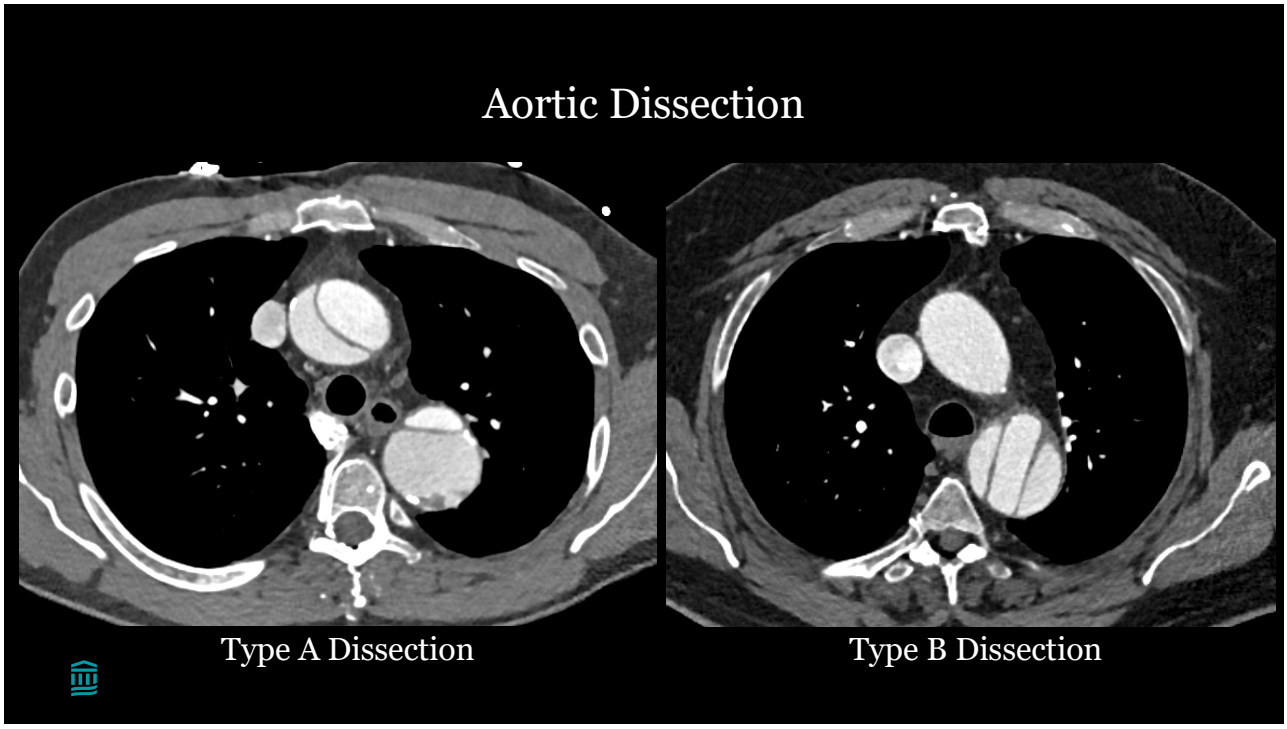
Imaging findings:

Filling defects in the pulmonary arteries



Right Heart Strain in Pulmonary Emboli

67 year old male
with back pain



Aortic Dissection
Type A Dissection
Type B Dissection

ACR Appropriateness Criteria®

The ACR Appropriateness Criteria® (AC) are evidence-based guidelines to assist referring physicians and other providers in making the most appropriate imaging or treatment decision for a specific clinical condition. Employing these guidelines helps providers enhance quality of care and contribute to the most efficacious use of radiology.

Part V:
Oral and Intravenous Contrast for CT Examinations

Evaluation of Acute Abdominal Pain in the Emergency Setting Using Computed Tomography Without Oral Contrast in Patients With Body Mass Index Greater Than 25.

Uyeda JW[1], Yu H, Ramalingam V, Devalapalli AP, Soto JA, Anderson SW.

Author information

Abstract

PURPOSE: To evaluate the rate of delayed or missed diagnoses and need for additional computed tomography (CT) imaging in emergency department patients with abdominal pain who are imaged without oral contrast.

MATERIALS AND METHODS: The institutional review board approved this Health Insurance Portability and Accountability Act-compliant retrospective study; informed consent was waived. All consecutive adult patients with body mass index greater than 25 undergoing a CT abdomen/pelvis with intravenous contrast and without oral contrast with nontraumatic acute abdominal pain during a 16-month period at our academic tertiary care center were included. Medical records were reviewed, imaging findings on admission CT, use of repeat CT examinations within 4 weeks of the original examination, and clinical outcomes were recorded. In patients undergoing repeat imaging, an investigator determined whether repeat imaging was influenced by the lack of oral contrast on the original examination. As the most common cause of bowel-related positive CT scans, an analysis of acute appendicitis was performed.

RESULTS: Of the 1992 patients included in this study, 4 patients (0.2%) underwent repeat CT studies directly related to the absence of oral contrast on the original examination. Of the 1992 CT scans, 1193(59.8%) were interpreted as negative, none of which required surgery or direct intervention. In patients with acute appendicitis, there was a sensitivity of CT in this patient population of 100% with a specificity of 99.5%.

CONCLUSIONS: In patients with body mass index greater than 25 presenting to the ED with acute abdominal pain, CT examinations can be acquired without oral contrast without compromising the clinical efficacy of CT.

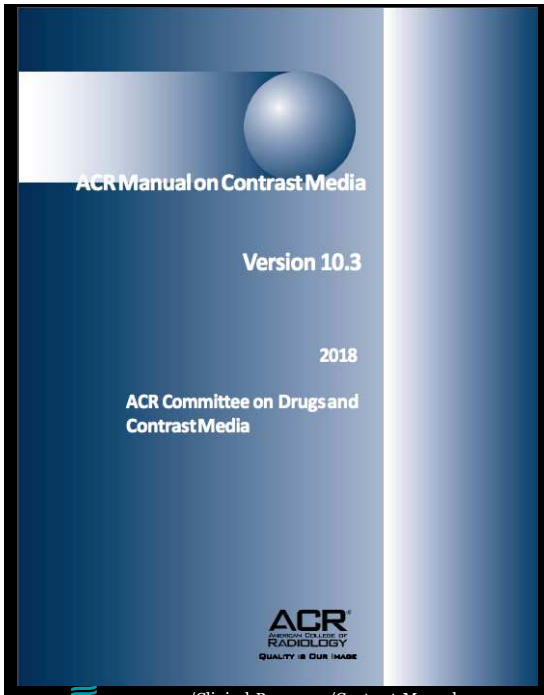
Part VI: Renal Failure and Contrast Allergies



www.acr.org/Clinical-Resources/Contrast-Manual

Contrast-Induced Nephropathy

- "At the current time, it is the position of ACR Committee on Drugs and Contrast Media that CIN is a real, albeit rare, entity."
- Literature fails to include control group
- Studies done on cardiac angiography patients → overestimate CIN risk
- Threshold eGFR ≥ 30 mL/min/1.73m^2

Risk Factors Warranting Renal Function Assessment

- Age > 60
- History of renal disease, including:
  - - Dialysis
    - Renal cancer -Single kidney
  - - Kidney transplant - Renal surgery
- History of hypertension requiring medical therapy
- History of diabetes mellitus
- Metformin or metformin-containing drug combinations
- *Patients scheduled for routine intravascular study but do NOT have one of the above risk factors do NOT require a baseline serum creatinine determination before iodinated contrast medium administration.

www.acr.org/Clinical-Resources/Contrast-Manual

Dialysis Patients

- Patients with anuric end-stage renal disease who do not have functioning transplant can receive IV contrast
- Theoretical risk of converting oliguric patient on dialysis to anuric patient but remains speculative
- Low-osmolality contrast is readily cleared by dialysis. Unless unusually large volume of contrast is given, or there is substantial underlying cardiac dysfunction, there is **NO** need for urgent dialysis after contrast

www.acr.org/Clinical-Resources/Contrast-Manual

Allergic Reactions

Hydrocortisone-based: 5 hour prep (Inpatient & ED pts)

- 200 mg IV hydrocortisone 5 hours before contrast AND
- 200 mg IV hydrocortisone + 50 mg diphenhydramine 1 hour prior

OR

Prednisone-based: 13 hour prep (outpatient)

- 50 mg PO prednisone 13 and 7 hours before AND
- 50 mg PO prednisone + 50 mg diphenhydramine IV, IM, or PO 1 hour before

www.acr.org/Clinical-Resources/Contrast-Manual

Multiple Contrast Injections

No guidelines preclude multiple contrast injections in 24 hour period

Confirm that ordered IV contrast study is needed

Small risk of renal failure

Borderline eGFR (<30-45): consider hydration with normal saline

- 100 mL/hr for 1 hour and 4 hours following scan
- Total 500 mL

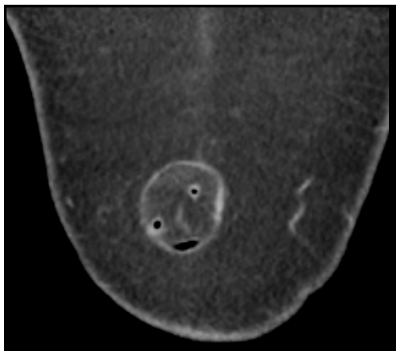
Allergic Reactions

- Premedication does not prevent all reactions
- Has not been confirmed to reduce moderate to severe reactions or reaction-related deaths
- Limited supporting efficacy in high-risk patients
- History of prior severe contrast reaction is considered a relative contraindication
- Rare situations where urgency of contrast study may outweigh benefits of prophylaxis → must be made jointly by radiology, referring service, and the patient (if feasible) and resuscitation team should be available

www.acr.org/Clinical-Resources/Contrast-Manual

Lecture Summary

- Interpret basic chest radiographs
- Recognize and locate various tubes and lines
- Identify “can’t miss radiology diagnoses” on plain x-ray and CT
- Discuss various imaging protocols and considerations
- Recognize the pros and cons of IV and PO contrast use in CT
- Optimally triage renal failure and contrast allergy patients



Thank you!
